

Weatherization and Intergovernmental Program

Accelerating Adoption of Energy Efficiency and Renewable Energy

The DOE/EERE Weatherization and Intergovernmental Program (WIP) increases awareness and accelerates adoption of practices and technologies that cost-effectively increase energy efficiency, the use of renewable energy, and oil displacement. It develops information and tools that remove specific market barriers to a more energy-efficient economy.

The program funds energy projects as well as technical assistance and tools for state governments, community action agencies, utilities, Indian tribes, and energy and economic development programs overseas.

Weatherization Assistance Program

The Weatherization Assistance Program works in partnership with states and more than 900 local agencies to provide weatherization services to approximately 100,000 low-income families annually.

Since the inception of the program in 1976, it has provided services to more than 5.6 million homes and produced annual savings of 30.5 trillion British thermal units (Btu). This country's largest energy efficiency program awards annual grants to state weatherization programs. DOE historically provides 40% of all weatherization funding, while states, the U. S. Department of Health and Human Services Low-Income Home Energy Assistance Program, and utilities contribute the remaining funds.

The Weatherization Assistance Program reduces the energy expenditures of low-income families by increasing the energy efficiency of their homes. Clients receive a series of cost-effective measures that are tailored to their homes and climate. Under current prices, the average first-year savings for weatherization clients is \$358, which equates to a 32% reduction in

heating costs. Weatherization returns \$1.53 in energy-related benefits for every \$1 invested in the Program. Taken together, \$2.60 in energy and nonenergy benefits is the return on every \$1 invested in the program.

State Energy Program

The State Energy Program (SEP) funds states to carry out their own energy efficiency and renewable energy programs. The states can tailor projects to meet individual needs, economic conditions, climate, and renewable resources. State projects address energy efficiency and renewable energy technologies across all market sectors. DOE technical assistance helps states develop projects and accelerate the adoption of renewable energy and energy efficiency technologies.

An annual DOE investment of approximately \$42 million in SEP is

augmented by funding from state and local governments and the private sector of more than \$450 million. Annual energy savings from these activities amount to 47.6 trillion Btus, which is enough to meet the non-transportation energy needs of 289,000 families. The annual savings in energy bills amounts to \$333.6 million.

SEP also directs funding from EERE technology programs to the states for specific projects to advance the adoption of emerging energy technologies. These projects represent an archive of the nation's experience in conducting energy programs.

The Illinois "Corn Bus" has been featured in numerous parades and local events. Fourteen ethanol-powered buses operate along regular routes in Peoria, Illinois.

Renewable Energy Production Incentive

The Renewable Energy Production Incentive (REPI) provides financial incentives to public utilities, not-for-profit electric cooperatives, Indian tribal governments, and Native American corporations for electricity produced from renewable energy. Qualifying facilities receive \$0.015 per kilowatt-hour (kWh) for the first 10 years of operation. Congress initiated the program because municipal utilities and not-for-profit electrical cooperatives are not eligible for production tax credits that are available to tax-paying utilities. Since 2000, \$26 million from REPI to qualifying facilities has produced more than 4.3 billion kWh from renewable energy resources.

Tribal Energy Program

The DOE Tribal Energy Program promotes tribal energy sufficiency, economic development, and employment on tribal lands through the use of renewable energy and energy efficiency technologies. Tribes receive financial and technical assistance through government-to-government partnerships that allow tribal leaders to make informed decisions about energy, bring renewable energy and energy efficiency options to Indian tribes, enhance human capacity through education and training, and improve local tribal economies and the environment.

Since 1992, DOE has invested \$12.4 million in 76 projects in Indian Country, and participating Indian tribes have contributed an additional \$3.3 million to these energy projects.

American Indians from Sioux Indian Tribe (Rosebud Reservation in South Dakota) take a tour of the Ponnequin Wind Farm, Weld County, Colorado

International Program

The DOE International Renewable Energy Program demonstrates and encourages the use of renewable energy and energy-efficient technologies in international markets. Historically the Program has leveraged funding from international organizations and replicated successes to other countries, while expanding the demand for U.S. energy technologies.

A Strong Energy Portfolio for a Strong America

Energy efficiency and clean, renewable energy will mean a stronger economy, a cleaner environment, and greater energy independence for America. Working with a wide array of state, community, industry, and university partners, the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy invests in a diverse portfolio of energy technologies.
